

General Notes

Earthquake Hits Home

House collapses, water pipes bust

*Platelets (Clot)*

Furniture is torn to shreds, decor shattered

*Neutrophils (Remove waste)*

>Takes two trips

*Macrophages (Remove neutrophils and excess waste)*

Begin creating the blueprint, throwing up structural walls

*Fibroblasts-Collagen 3*

Finalize structure, floor installed, walls painted

*Fibroblasts-Collagen 1*

Think of the emotional trauma of losing your home, you want it up and back to normal as fast as possible— wanting a robust inflammation and quickly begin rebuilding. Although it's impossible to create a house in 72 hours, that is an appropriate time frame for inflammatory response within the body. However, it is all dependent on the severity of injury. Also, consider each step as a Coachella Festival, each egotistical pop singer want their time on the stage without abruption. Each step wants their time to shine, but they can't create a house (or music festival) without each other or the necessary tools (cells, blood, and the tissue to be touching).
